Seller A reputation

Joint probability mass per grid cell (linear scale)

0.00 0.01 0.02 0.03 0.04 0.05

20 paired paths; 100,000 retained periods; 10,000 burn-in; start (0.5, 0.5). Actual two-seller TS demand.

Empirical calendar-time laws; finite burn-in can leave initialization bias.

Identical axes and mass scale; zero mass is dark purple.

Linear color scale fixed to the original $\rho = 0.95$ comparison: 0 to 0.0528115.

The upper colorbar triangle indicates saturation above this limit.
