Joint reputation distributions: saved stationary and simulated

OE distribution Saved stationary | OE distribution Simulated | OE p0 Saved stationary | OE p0 Simulated

$\rho = 0.60$ Seller B reputation

$\rho = 0.70$ Seller B reputation

$\rho = 0.80$ Seller B reputation

$\rho = 0.90$ Seller B reputation

$\rho = 0.95$ Seller B reputation

$\rho = 0.97$ Seller B reputation

$\rho = 0.99$ Seller B reputation

$\rho = 0.999$ Seller B reputation

99.999% of mass on $x_A = 0$ or $x_B = 0$

99.999% of mass on $x_A = 0$ or $x_B = 0$

Seller A reputation

Joint probability mass per grid cell (log scale)

20 paired paths; 100,000 retained periods; 10,000 burn-in; start (0.5, 0.5). Actual two-seller TS demand.

Saved stationary: verified finite-grid laws. Simulated: empirical calendar-time frequencies; finite burn-in can leave initialization bias.

All 32 panels use the same axes and log color scale as 05 and S01; boundary nodes are drawn at full cell width.
