Product 2 use from the common initial state (0.5, 0.5)
Saved policies from earlier experiments · M = 20 independent simulations per policy

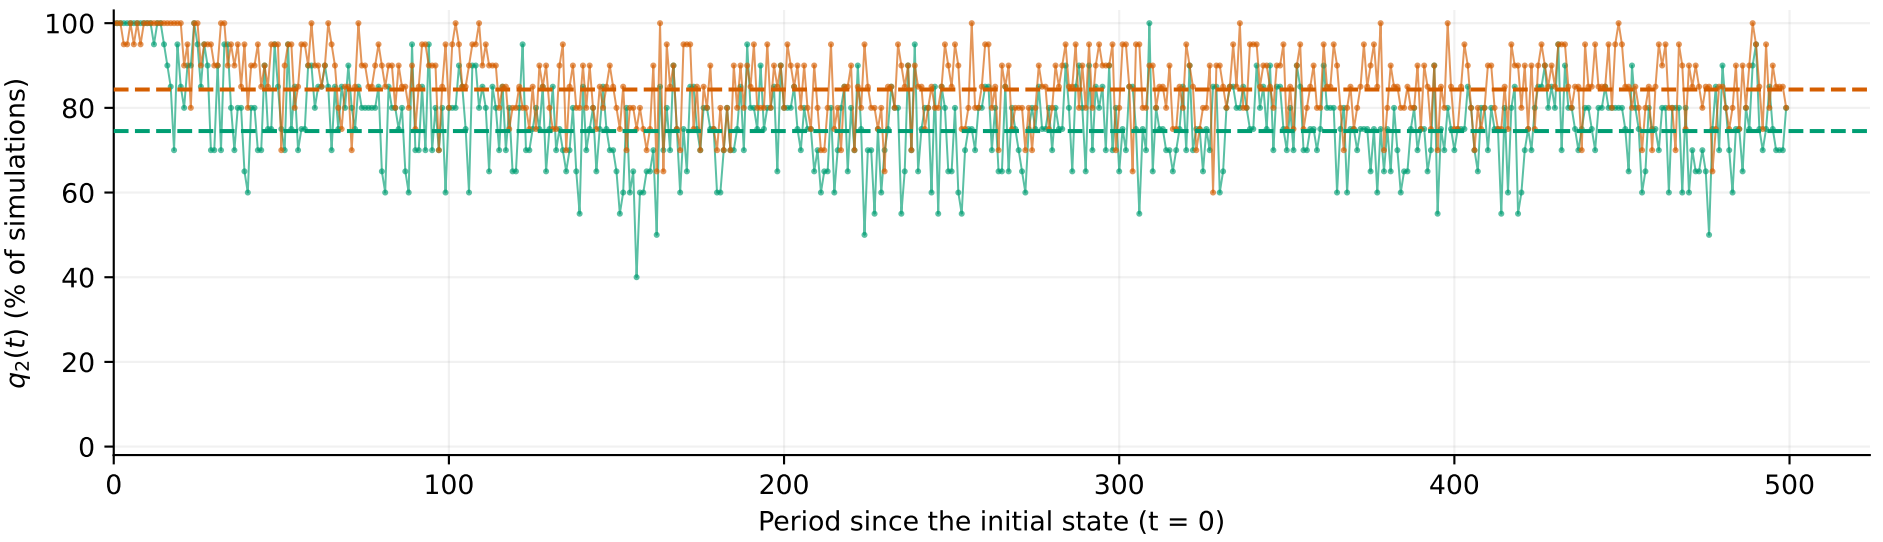

Reputations restricted to saved values
Frequency in each period, without smoothing

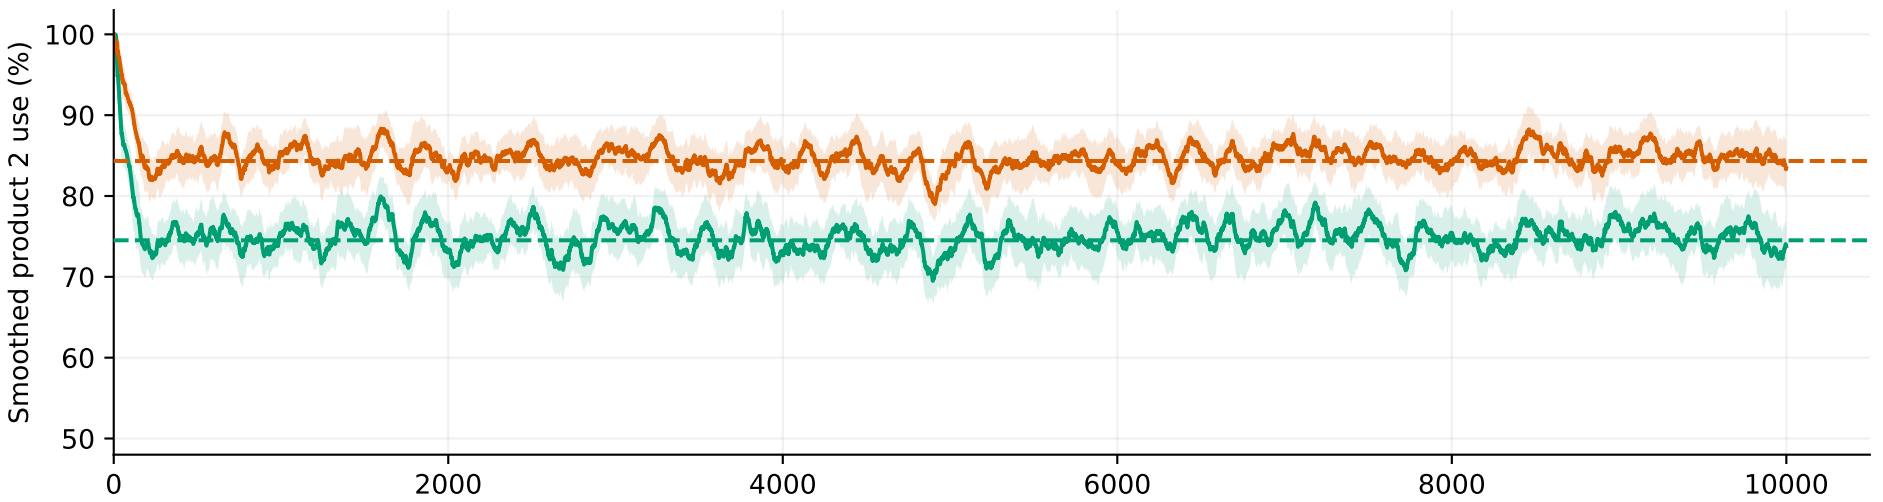

Reputations restricted to saved values
Moving average of product 2 use

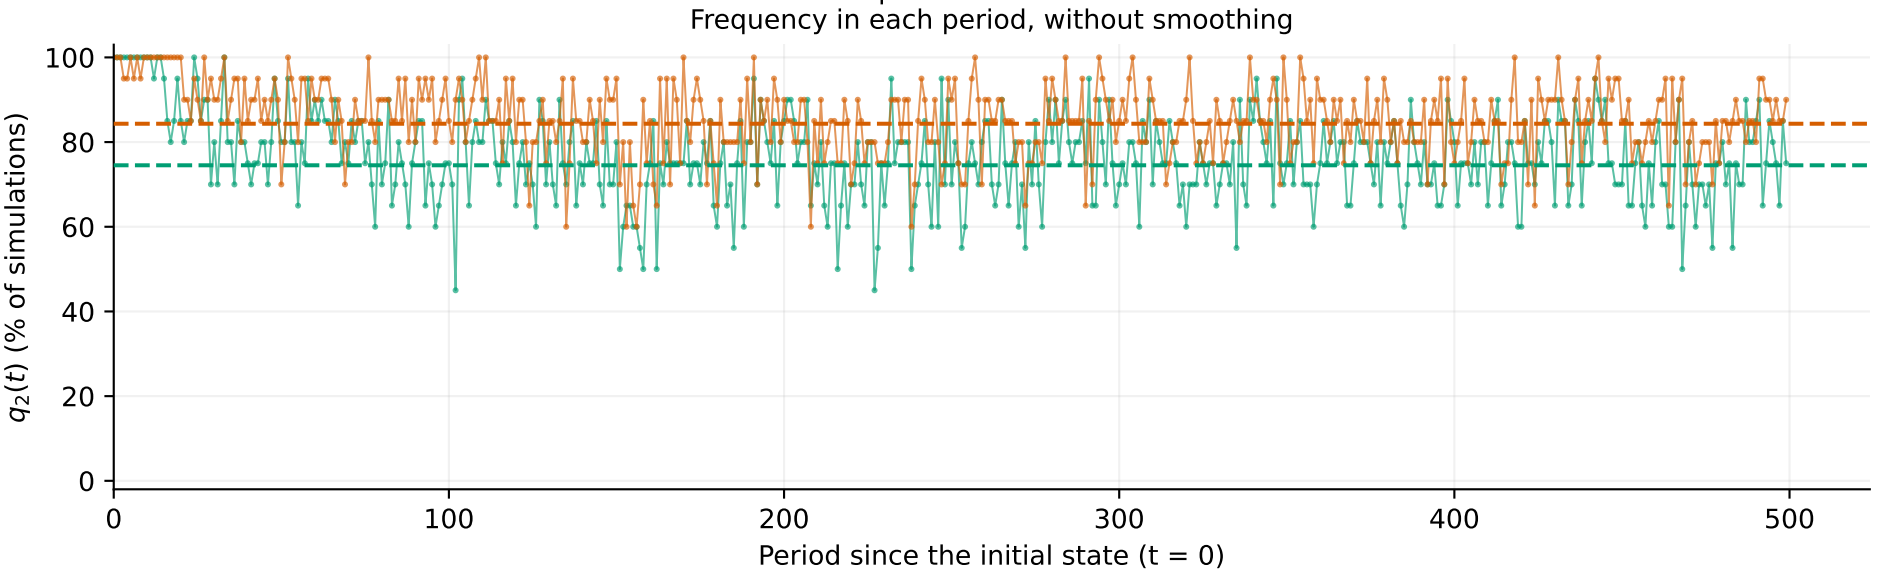

Continuous reputations: closest saved rule
Frequency in each period, without smoothing

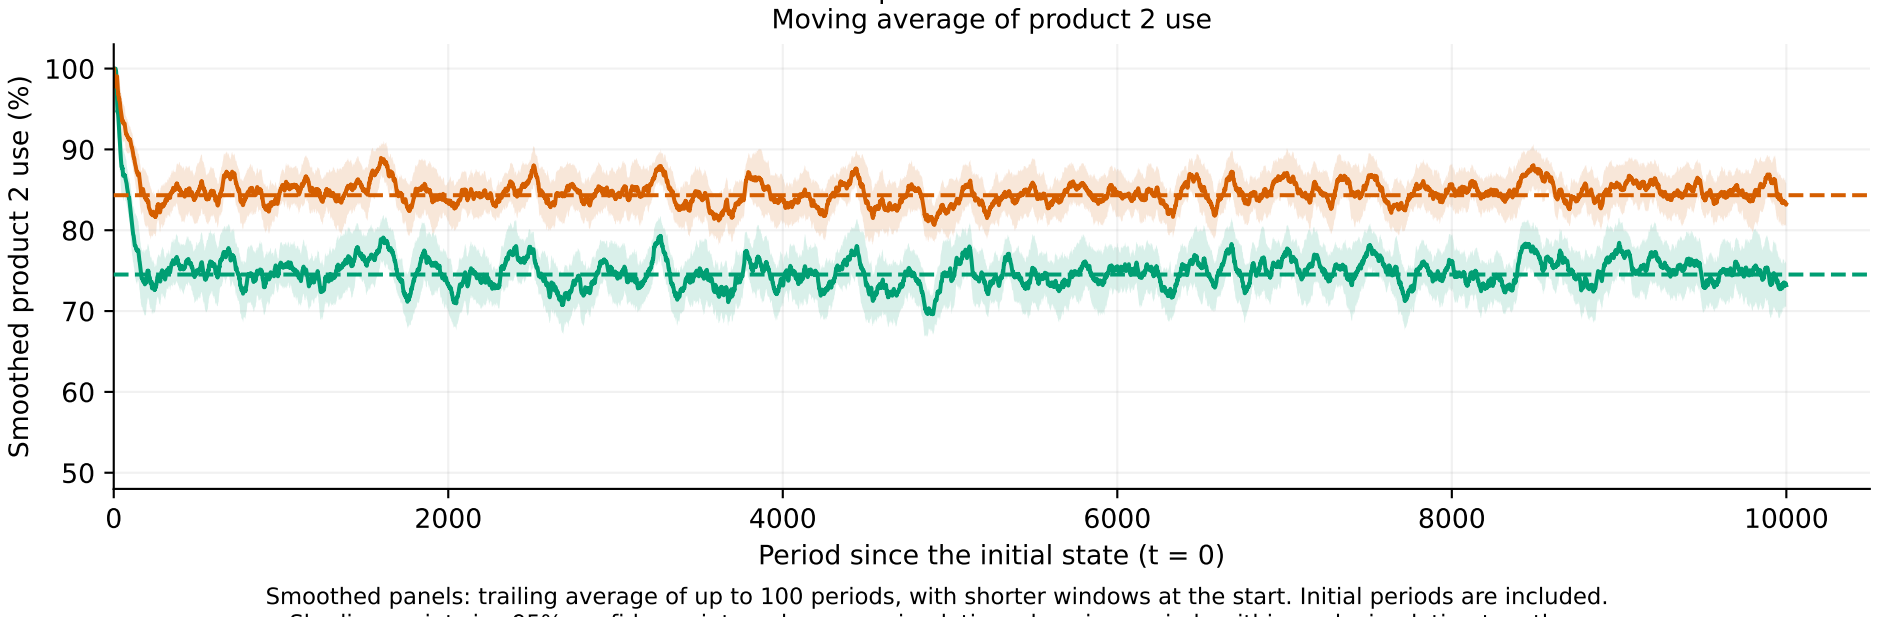

Continuous reputations: closest saved rule
Moving average of product 2 use

Continuous reputations: blended saved rules
Frequency in each period, without smoothing

Continuous reputations: blended saved rules
Moving average of product 2 use

Smoothed panels: trailing average of up to 100 periods, with shorter windows at the start. Initial periods are included.
Shading: pointwise 95% confidence intervals across simulations, keeping periods within each simulation together.
Dashed lines: product 2 frequency calculated from each policy's saved joint stationary distribution.
For continuous reputations, these are references from the original reputation values.
