Optimal policies: monopoly at the OE p0 equilibrium benchmark

Competition (OE p0) | Monopoly (forgetting) | OE p0 mixing at a grid point

$\rho = 0.6$, $p_0^{OE} = 0.499987$

$\rho = 0.7$, $p_0^{OE} = 0.529007$

$\rho = 0.8$, $p_0^{OE} = 0.588874$

$\rho = 0.9$, $p_0^{OE} = 0.669681$

$\rho = 0.95$, $p_0^{OE} = 0.680475$

$\rho = 0.97$, $p_0^{OE} = 0.639605$

$\rho = 0.99$, $p_0^{OE} = 0.434271$

$\rho = 0.999$, $p_0^{OE} = 0.175649$

Both policies choose product 1

Probability of product 2

Own reputation

Same fixed benchmark and Bellman equation; common 51-point mature-state grid.
Forgetting uses its original pure choice rule (product 1 at numerical indifference); OE p0 retains its saved mixtures.
