
Monopoly: one seller versus fixed $p_0^{OE}(\rho)$. Competition: two sellers following OE p0.

20 paths; 100,000 retained periods; 10,000 burn-in; initial reputation 0.5; common 51-point grid.

At high rho, finite-window and stationary predictions differ; 20-path MC intervals can also miss rare events.

Rho values are equally spaced; lines guide the eye. Stationary results refer to this finite grid.
