
Monte Carlo over time: monopoly, marginal OE and conditional OE
$\rho = 0.7$, $c_2 = 0.65$ | 20,000 paths | saved n=101 policies | common mature start $x = 0.5$
25-period blocks; no burn-in removed; grid interpolation after observed outcomes.

Primary metric over time: product 2 among own sales
Shading: nominal 95% path-cluster intervals; dotted lines are stationary references.
$\rho = 0.7$, $c_2 = 0.65$ | 20,000 paths | saved n=101 policies | common mature start $x = 0.5$
