
Successor-demand diagnostics | fixed p₀ = 0.8
$x_s = \rho x + 1 - \rho, \quad x_f = \rho x$ | Linear interpolation of saved perceived demand
Circle area = stationary probability of own reputation x (calendar periods)
Average successor demand
$[d(x_s) + d(x_f)]/2$
ρ = 0.6 | n = 41
Demand probability
Own reputation x
Demand sensitivity to the outcome
$d(x_s) - d(x_f)$
ρ = 0.6 | n = 41
Demand difference
Own reputation x
Saved product policies
ρ = 0.6 | n = 41
Pr(product 2 | own sale, x)
Own-state frequency (% of calendar periods)
N=1
N=2
N=3
Own reputation x
N=1 monopoly
N=2 marginal OE
N=3 marginal OE
Policies differ at saved nodes
