Experiment 12 — Fixed-rival diagnostic: $p_0 = 0.8$, $\rho = 0.9$
Equilibria pass the global unilateral-deviation test; the diagonal profit curve is a reference.
Average profits and best-response values
Average profit / seller / period
Candidate mixture u
Monopoly profit ΠM(u)
Symmetric profit ΠC(u,u) — reference
Best-response value against rival u
Unilateral deviation profit: rival held fixed
ΠC(v, fixed rival u)
Own mixture v
Rival fixed at u=0
Rival fixed at u=1
Best-response correspondence against fixed rival
Own best-response mixture v
Rival mixture u
All detected global best responses
Symmetric mixture v=u
Verified symmetric equilibrium
Maximum unilateral deviation gain (nonnegative)
Profit gain / seller / period
Candidate symmetric mixture u
g(u) = maxv ΠC(v,u) − ΠC(u,u)
Largest candidate tolerance 1.3e-10
Equilibrium-specific tolerance
